

RuralCare Firebase Setup and Database Guide

Firestore project names

Use a Firebase project name like RuralCare Demo and a project id like ruralcare-demo. The app uses these Firestore collection names exactly:

- adminAccounts
- staff
- patients
- services
- requests
- notifications
- auditLogs
- loginAttempts

Required Firebase products on Spark plan

Enable only:

- Firebase Authentication
- Cloud Firestore
- Firebase Cloud Messaging, optional for later device push work

Cloud Functions are not required and were removed.

Authentication setup

Enable these Firebase Auth providers:

- Phone provider for Patient OTP login and registration.
- Anonymous provider for Admin and Staff demo sessions after Firestore credential verification.

Admin and Staff credentials are stored directly in Firestore for demo purpose only.

Default admin for demo

The app creates the first admin automatically the first time you login with:

```
text
username: admin
password: Admin@12345
security answer: hospital
```

After login, you can create staff users from the Admin Staff screen.

First-time setup commands

Run these from D:\ruralcare:

```
powershell
flutter pub get
firebase login
firebase use --add
flutterfire configure
```

```
firebase deploy --only firestore:rules,firestore:indexes
flutter run
```

Database fields

adminAccounts: uid, username, usernameLower, password, securityQuestion, securityAnswer, createdAt, updatedAt.

patients: uid, fullName, mobile, gender, dob, aadhaarMasked, aadhaarCipherText, address, bloodGroup, email, fcmToken, createdAt, updatedAt.

staff: uid, fullName, designation, staffId, username, usernameLower, password, mobile, age, department, active, deleted, createdAt, updatedAt.

services: name, charge, active, createdAt, updatedAt.

requests: patientUid, patientName, patientMobile, patientAddress, recipientType, recipientName, recipientAge, serviceId, serviceName, serviceCharge, preferredAt, status, claimed, assignedStaffUid, assignedStaffName, assignedStaffMobile, rejectionReason, proposedAt, proposedMessage, completedAt, createdAt, updatedAt.

notifications: userUid, role, title, body, requestId, read, createdAt.

loginAttempts: role, username, success, reason, createdAt.

Demo security note

This Spark-plan version intentionally stores Admin and Staff passwords in Firestore so the app can run without Cloud Functions. Use this only for project/demo submission. For real production, move password verification and Aadhaar encryption to a trusted backend.
